

Xpander2 Stack

Made by IDSIGN - www.idsign-shop.com

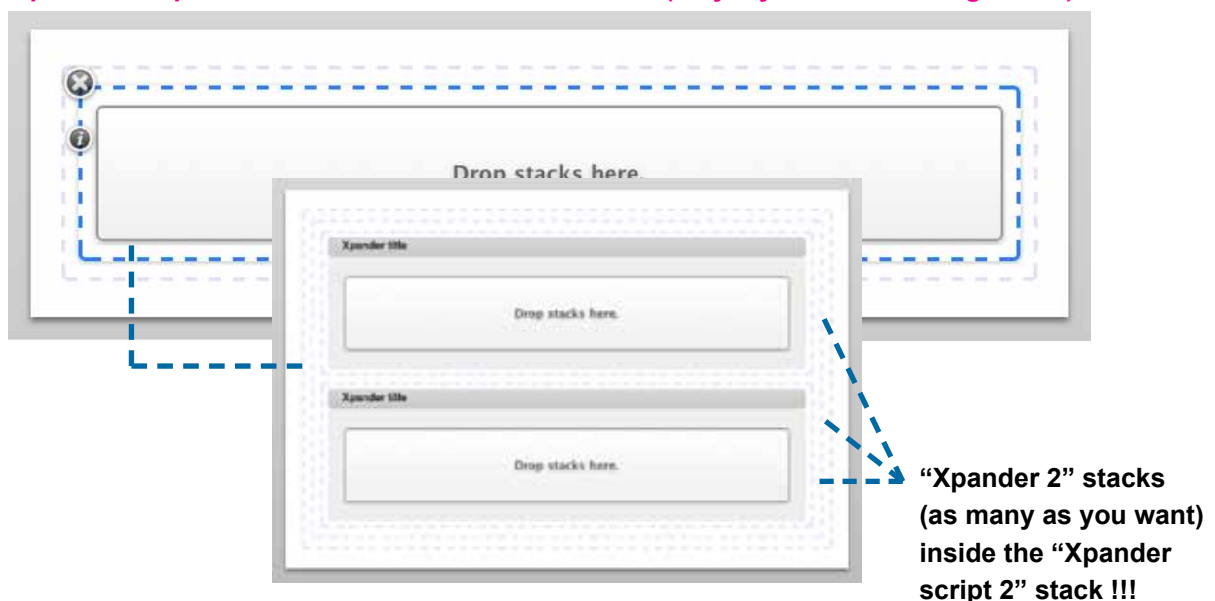

With this brief manual you can create a beautiful Xpander 2 on your site. Just drag first a basic “stack” stack on your page (you could give this stack a background and padding if you want (only necessary -> FOR IE6 !!!)), drop inside this stack the “Xpander script 2” stack and drop a few “Xpander 2” stacks inside this “Xpander script 2” stack. Make your design (best non-scripting stacks!) inside this stack. Give every stack a titel... your started

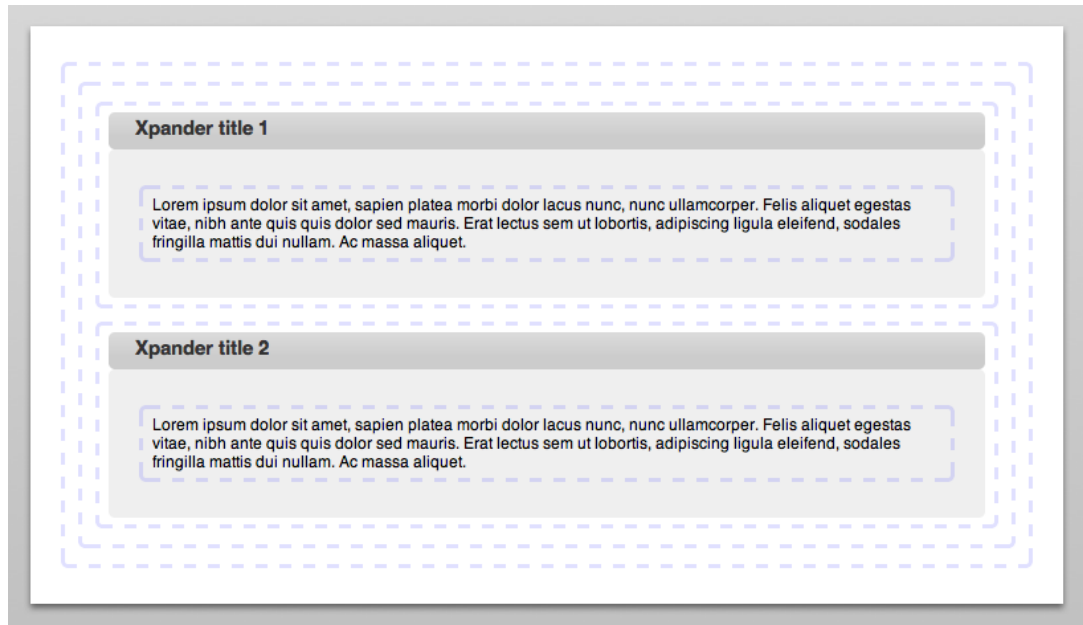

How does it work?

Start by installing the “Xpander 2” and “Xpander Script 2” stacks and restart RapidWeaver for the new stacks to become available. Switch into edit mode and drag first a basic “Stack” stack (only if you want a background color-necessary for IE6) and then the **Xpander script 2 stack** into this stack. You will see this window:

Xpander script 2 stack inside a basic “stack” stack (only if you want a backgr-color)

Make your design within the “Xpander 2” stacks and change the title in the info panel

Modify the background and padding from the “stack” stack (if you want - **necessary for IE6**) and set the padding and margin from all inserted stacks to “off”. If you don’t want a background you can delete the “stack” stack and just drop a “Xpander script 2” stack on the page and inside this stack some “Xpander 2” stacks

Open the info panel from the “Xpander Script 2” stack and change whatever you want:

Important:

- 1) Nested Xpander’s does not work with this stack!!
- 2) Do not change the basic background from the “Xpander script 2” stack (see page 1)
- 3)Text between the Xpander’s (not inside) is still possible
- 4) Drop all “Xpander 2” stacks **INSIDE** the “Xpander script 2” stack

“Start open” if you want the first Xpander open on page enter.

“Xpander height” is the height of the button you see on page enter.

“Padding top” changes the distance from the top relative to the title.

Border Radius makes round corners (ONLY ON MOZILLA BROWSERS)

Changes the size of the title.

Change the colors of each item from the stack to fit your design.

“Backgr color” change the background of the content area

“Padding Content” changes the padding in the content area

“Bgr Image” Insert a background image in the content area of the Xpander (full path !!!)

If you want to repeat the image only on top - don’t mark the checkbox. Only mark it if you want the background to be repeated over the entire content
